

3)

A bowl of hemispherical shape, with radius

$$R = 0.14 \text{ m}$$

sits on table.

A marble displaced by small distance

$$x \ll R$$

oscillates around bottom.

What is period of oscillation?

When displaced by  $x$ , the marble has height  $y$  above bottom.

$$\text{GPE} = mgy$$

but

$$x^2 + y^2 = R^2 \quad \text{for circle at origin}$$

$$\rightarrow y^2 = R^2 - x^2$$

This circle is not centered at origin, but at

$(0, R)$ . So

$$y = R - [R^2 - x^2]^{1/2} \quad \text{for circle at } y=R$$

$$= R - \left[ R^2 \left( 1 - \frac{x^2}{R^2} \right) \right]^{1/2}$$

$$= R - R \left( 1 - \frac{x^2}{R^2} \right)^{1/2}$$

Use binomial theorem

$$y \approx R \left( \frac{1}{2} \frac{x^2}{R^2} \right)$$
