

Light waves from two lasers approach a pool of oil. The lasers have wavelengths in a vacuum

$$\lambda_1 = 400 \text{ nm} \quad \text{in Vacuum}$$

$$\lambda_2 = 600 \text{ nm} \quad \text{in Vacuum}$$

a) angular frequencies are

$$\omega_1 = 2\pi f_1 = 2\pi \left(\frac{c}{\lambda_1} \right) = 4.7091 \times 10^{15} \frac{\text{rad}}{\text{s}}$$

$$\omega_2 = 2\pi f_2 = 2\pi \left(\frac{c}{\lambda_2} \right) = 3.1394 \times 10^{15} \frac{\text{rad}}{\text{s}}$$

and these remain the same in the oil.

b) wavelengths in vacuum are

$$\lambda_1 = 400 \text{ nm} \quad \text{in Vacuum}$$

$$\lambda_2 = 600 \text{ nm} \quad \text{in Vacuum}$$

but these will change in oil.

The oil has index of refraction

$$n(\lambda) = \left(1 + \frac{0.1 \cdot 300 \text{ nm}}{\lambda} \right)$$

c) In the oil, the wavelengths become

$$\lambda'_1 = \frac{\lambda_1}{n(\lambda_1)} = \frac{400 \text{ nm}}{1.075} = 372.1 \text{ nm}$$

$$\lambda'_2 = \frac{\lambda_2}{n(\lambda_2)} = \frac{600 \text{ nm}}{1.050} = 571.4 \text{ nm}$$

d) and wave numbers

$$k'_1 = \frac{2\pi}{\lambda'_1} = 1.6886 \times 10^7 \frac{\text{rad}}{\text{m}}$$

$$k'_2 = \frac{2\pi}{\lambda'_2} = 1.0996 \times 10^7 \frac{\text{rad}}{\text{m}}$$
