

RIT Observatory Open House, Nov 4, 2022

**Jupiter and Saturn have lost one moon each!
Can you find it using our telescopes, and draw
it into the proper location?**

Look through our telescopes, mark the position of the missing moon, and show it to the Astronomer At The Table. You may earn official Astro-Stickers!

Tonight's Moon has bright craters and dark "seas". Your job: look through our telescopes, compare with the map below, and mark the positions of

- a) the crater Copernicus**
- b) the Sea of Tranquility**

Bonus! Did Apollo spacecraft land near one of these?
